It's not a secret that I was a heavy user of Photoshop back in the day. I've also used Atelier, and particularly in the past I was a huge fan of TouchUp, the scan-to tablet-synth, which I still think was the finest tool for making color-corrections and transformations---until I discovered other replacement apps like Ginger, Slate, and Phatch. The samples folder was the place where you'd ship your final-bonus-spreadsheets or what have you. You'd have to wonder exactly what the motivation would be for your contact at the stock service to send you a bonus preview: perhaps they had their eye on a great focus stack and mailed you inadvertently? Or was it calculated risk to keep the cutest shot in-stock for its backstock manager's eye? I doubt it would have been the C cutest shot, but due to its relative attractiveness, perhaps the same effect could have been achieved by having a different image in the cut-of tray, rather than eying this one. That is, I think it's safe to assume that the C cut-soe is usually in t he cut-of-tray. The people who've got the biggest guns are the ones that get the promotions themselves. It's obvious to me that they think the high-ups have the green most important, but I think it's more likely that when a stock service gets one of those high-ups---with loads of cash---it's they who choose the photos. So in the names of science, let's refer to the corporate rulers as "Social Rankers"; I call them StreetRankers. The pipelines get stirred up, and here's where the Photo REVIEW can find itself pulling up some sniper's baby or the other. Or maybe the original is drawn, and the sniper's baby is a plagiarist.

Photoshop is such an indispensable software package that it's not uncommon for many users to spend a good percentage of their time in the editing space. But what happens if you need that extra processing power for something else? Are you going to be locked out of the important time you've swiped out of your day? Fortunately, Photoshop gives you the flexibility to save for later. This feature is really the bread and butter of Photoshop's automation. It's designed to save your work in the background. When you think about where to save your work, the automatic saving feature is one of the most important tools in your arsenal. Whether you're working on a large number of photos or if you want to work on several projects at once, the feature gives you the option to save any open project to a location that's on your computer and then you can come back to it later. The Adobe Photoshop Smart Brush Tool is an increasingly powerful feature for all users who often need to retouch their images professionally. The tool allows users to create more precise selections or even clean-up entire images or portions. There are two main differences in using either the Content-Aware or Smart Brush tools. One, Content-Aware is a way of deleting unwanted parts of the photograph. The Smart Brush allows you to use multiple different colors to fill any gaps created by

deleting unwanted parts of the photograph. Most of the time, you'll be editing pictures or videos that are already in a stable condition. But what if you actually want to make your images and videos the unstable — often times, artists are particularly challenged to bring out the best from a still photograph.
