Scramble password data by using first the md5hash function, which hashes a password, followed by the md5 encryption function, which encrypts the password. Keymacro is a standalone password encryption and decryption tool that converts ordinary passwords into SHA1 hashes and back again. By using MD5, the application allows you to scramble passwords by using a simple tool that operates in command-line mode. Keymacro will not be able to crack passwords that are encrypted using MD5 using brute force attacks, which means the app could resist pre-calculated rainbow tables. However, you may still be vulnerable to rainbow table attacks. It's also worth noting that Keymacro does not support SHA1 encryption, which means it's not possible to make use of the application in a brute force attack. A file is downloaded after the hash function is applied. Unlike many other online password scramblers, this utility is usable offline as well. Simply extract the executable file and run it to get started. Ease of use Using Keymacro is extremely easy. A password to be scrambled or unscrambled is entered, and you're prompted to either press the Enter key to continue or make a choice from the command-line options. Keymacro will accept the following characters, numbers, and

special characters: a-z A-Z 0-9 # \$ % ! @ # \$ % ^ + * , . _ : - To decrypt the password, you're prompted to enter a salt. The salt is a random string that needs to be entered to begin the decryption process. You'll be asked to enter a new salt to decrypt the password a second time. You're prompted to enter a new salt when you change the current encryption method. If you choose to scramble the password, the application will prompt you to enter the password. The password is then hashed using the md5() function. The hashed password is then encrypted using the md5() function. The encrypted password is stored in a text file that is created. When you choose to unscramble the password, the encrypted password is decrypted and hashed again. The result is sent to the console, where it's displayed and the password is displayed in plaintext. Note that you're required to input a new salt for every encryption/decryption attempt. In order for the 2edc1e01e8
