A: There is a wide range of things that go into the design of a power transformer, including cost, efficiency, and voltage levels. Simply telling us more about your application is not going to help you. As a starting point, look at the following references: AES Power Transformer Reference Polyphase Inductor and Power Transformer Reference Q: Accessing an HTML element inside a data-* attribute of a HTML string I need to create a function which will extract the data-* attribute and will fill a text input using it's values. If the attribute isn't filled, then I will try to access the parent element of the attribute then the element containing the attribute to fill the input. Example `var matchedInput = $("div").attr('data-type');` But I can't access this element if it's wrapped inside a string like the above example `var matchedInput = $(" ").attr('data-type');` I have searched about it but found nothing. A: Use text method `$(...).text(function(index, text) { // here you will get text field value });` or get text content with data function `$(...).data('some_data')` it will return data value for data-* attributes, and text content in others A: You can use `getAttribute("data-*")` to get all the data-* attribute values in an array and then use the third parameter of the `jQuery.filter()` method to get the one you are interested in. `var dataType = $(".matched-input").filter(function() { return $(this).data("group") == "Matching" && $(this).data("type") == 1; }).data("type")` The eruption of a volcano had been the biggest worry. But then tsunamis, plagues and nuclear bombs? Until now, Japan has largely been spared from the devastation of natural disasters. And while the country is on high alert for an impending earthquake that could trigger the country
