1)The early days of AutoCAD: The early days of AutoCAD have been mentioned in previous articles. AutoCAD has been around since 1987. In the early years, AutoCAD was actually a combination of AutoCAD & AutoCAD Pro and it was only on February 14, 1993 that it became separate product. 2) The AutoCAD revolution In the

early days of AutoCAD, the scope was very limited compared to today. However, AutoCAD was the first widely adopted CAD program on the desktop market and it had immediate impacts on the industry. People used to use traditional drafting tools such as pens, pencils, rulers, scales, and drafting boards to create drawings for projects. These drawings were then used to design

and engineer products, buildings and homes. Today, with AutoCAD's graphical interface, users can create drawings on the computer screen and use a keyboard to modify the drawings, manage files, and create a professional product. 3) AutoCAD as a drawing tool Today's AutoCAD users can turn it into a huge and versatile design and drafting tool with many different drawing types. An auto-

generated drafting symbol library helps users to create a range of drawing types such as electrical, mechanical, architectural, architectural drawings, architectural sections, structural, furniture, vehicle, civil engineering, and more.

4) AutoCAD as a DME tool

Today's users can use AutoCAD's drawing templates to create DME drawings such as architectural plans,

electrical plans, plumbing plans, mechanical plans, and more. This is especially helpful for home improvement projects such as room additions, master bathroom remodels, kitchen remodels, and more. 5) AutoCAD as a CAD tool Today's users can use AutoCAD to create architectural and engineering drawings. A feature called AutoCAD Architectural allows users to

make architectural drawings and to add custom components such as stairs, elevators, basements, floors, roofs, exterior walls, and more. AutoCAD Civil allows users to create civil engineering drawings such as structural engineering plans, mechanical engineering plans, plumbing engineering plans, electrical engineering plans, etc. 6) AutoCAD as a manufacturing tool Today's

AutoCAD users can create three-dimensional (3D) architectural, mechanical, and electrical

Category: Software that uses AutoLISPQ: Using Range or Regex to find words that do not contain letters I am creating a program that would check if an int is formatted correctly and if not, return an error.

Currently I am trying to figure out how to parse the numbers in a certain way.

For example, I want the program to return an error if the string is not formed in this way: Input = "5t+2"

Output = 5 I know how to do this with regex, but this program is only meant to check if the string is in the right format. For some reason I don't want to use regex since it seems to me like too much hassle when it comes to explaining to the user what to do. So I want to create a program that could look at all the numbers in a string to see if they form a word in some way. The user would input the string and

the program would check all the numbers to see if they are numbers or if they are formatted correctly.

However, I do not want any of the numbers that are not formatted correctly. That is, I would like the program to return an error if any of the numbers is not a word. I thought of using a Range or Regex function to find all the numbers in the string but I have not been able to figure out how to do it. Is

there a way to do this? I appreciate any help in advance. A: One possible way is to break the string into separate characters and check each character individually: function FindWordsInString(s : string) : boolean; var i,j,l,k : integer; begin l := length(s); if l = 0 then Exit(true); result := false; for i := 1 to l do begin for j := 1 to l do begin if s[i] in [Letter, Digit] then begin ca3bfb1094
